

# Lecture 4II

- Polynomial evaluation
- Lagrange polynomial
- Polynomial interpolation

# poly

- Given zeros, express a polynomial

```
poly([-5 0 5])
```

- `poly.m` returns coefficients of a polynomial with roots  $-5, 0$  and  $5$

```
>> poly([-5 0 5])
```

```
ans =
```

```
1 0 -25 0
```

$$p(x) = x^3 - 25x$$

# polyval

```
p=poly([-5 0 5]);  
x=linspace(-5,5);  
y=polyval(p,x);
```

- Polynomial evaluation
- polyval.m substitutes elements in x to polynomial p
- p is a vector that represents a polynomial with roots 5, 0 and -5

# Lagrange polynomial

- n knots,
- 

$$x = [x_1, \dots, x_n]$$

$$\begin{aligned}L_i(x) &= 1, \text{ if } x = x_i \\&= 0, \text{ if } x = x_j, j \neq i\end{aligned}$$

- $L_i$  denotes the ith Lagrange polynomial that responds one to  $x_i$  and zeros to the other knots

# Mathematical expression

$$L_i(x) = \frac{x - x_1}{x_i - x_1} \boxed{?} \frac{x - x_{i-1}}{x_i - x_{i-1}} \frac{x - x_{i+1}}{x_i - x_{i+1}} \boxed{?} \frac{x - x_n}{x_i - x_n}$$

$L_i(x) = 1$ , if  $x = x_i$   
 $= 0$ , otherwise

# Proof

$$L_i(x) = \frac{x - x_1}{x_i - x_1} \boxed{?} \frac{x - x_{i-1}}{x_i - x_{i-1}} \frac{x - x_{i+1}}{x_i - x_{i+1}} \boxed{?} \frac{x - x_n}{x_i - x_n}$$

$$L_i(x_i) = \frac{x_i - x_1}{x_i - x_1} \boxed{?} \frac{x_i - x_{i-1}}{x_i - x_{i-1}} \frac{x_i - x_{i+1}}{x_i - x_{i+1}} \boxed{?} \frac{x_i - x_n}{x_i - x_n} = 1$$

$$L_i(x_i) = 1$$

# Proof

$$L_i(x) = \frac{x - x_1}{x_i - x_1} \boxed{?} \frac{x - x_{i-1}}{x_i - x_{i-1}} \frac{x - x_{i+1}}{x_i - x_{i+1}} \boxed{?} \frac{x - x_n}{x_i - x_n}$$

$$L_i(x_{j \neq i}) = \frac{x_j - x_1}{x_i - x_1} \boxed{?} \frac{x_j - x_{i-1}}{x_i - x_{i-1}} \frac{x_j - x_{i+1}}{x_i - x_{i+1}} \boxed{?} \frac{x_j - x_n}{x_i - x_n} = 0$$

$$L_i(x_{j \neq i}) = 0$$

# Product form

$$\begin{aligned}L_i(x) &= \frac{x - x_1}{x_i - x_1} \boxed{?} \frac{x - x_{i-1}}{x_i - x_{i-1}} \frac{x - x_{i+1}}{x_i - x_{i+1}} \boxed{?} \frac{x - x_n}{x_i - x_n} \\&= \prod_{\substack{j=1 \\ j \neq i}}^n \frac{x - x_j}{x_i - x_j}\end{aligned}$$

# Lagrange polynomial

Given n knots,  $x_1, \dots, x_{i-1}, x_i, x_{i+1}, \dots, x_n$

Let  $L_i$  denote the ith Lagrange polynomial

- $L_i$  is a polynomial of degree  $n-1$
- $L_i$  has  $n-1$  roots:

$$x_1, \dots, x_{i-1}, x_{i+1}, \dots, x_n$$

- Normalization:  $L_i$  satisfies

$$L_i(x_i)=1$$

# Polynomial of n-1 roots

- $x$  is a vector that consists of  $n$  distinct knots

```
xzeros=[x(1,:i-1) x(i+1:n)];  
pi=poly(xzeros);
```

- $\pi$  is a polynomial whose roots are all knots except for  $x_i$

# Normalization

```
c=polyval(pi,x(i));  
pi=pi/c;
```

Normalization condition

$$L_i(x_i) = 1$$

# Implementation I

- Apply poly.m and polyval.m

```
xzeros=[x(1:i-1) x(i+1:n)];  
pi=poly(xzeros);
```

```
c=polyval(pi,x(i));  
pi=pi/c;
```

# Lagrange polynomial evaluation

```
y=lagrange_poly(v,x,i)
```

% x contains n knots

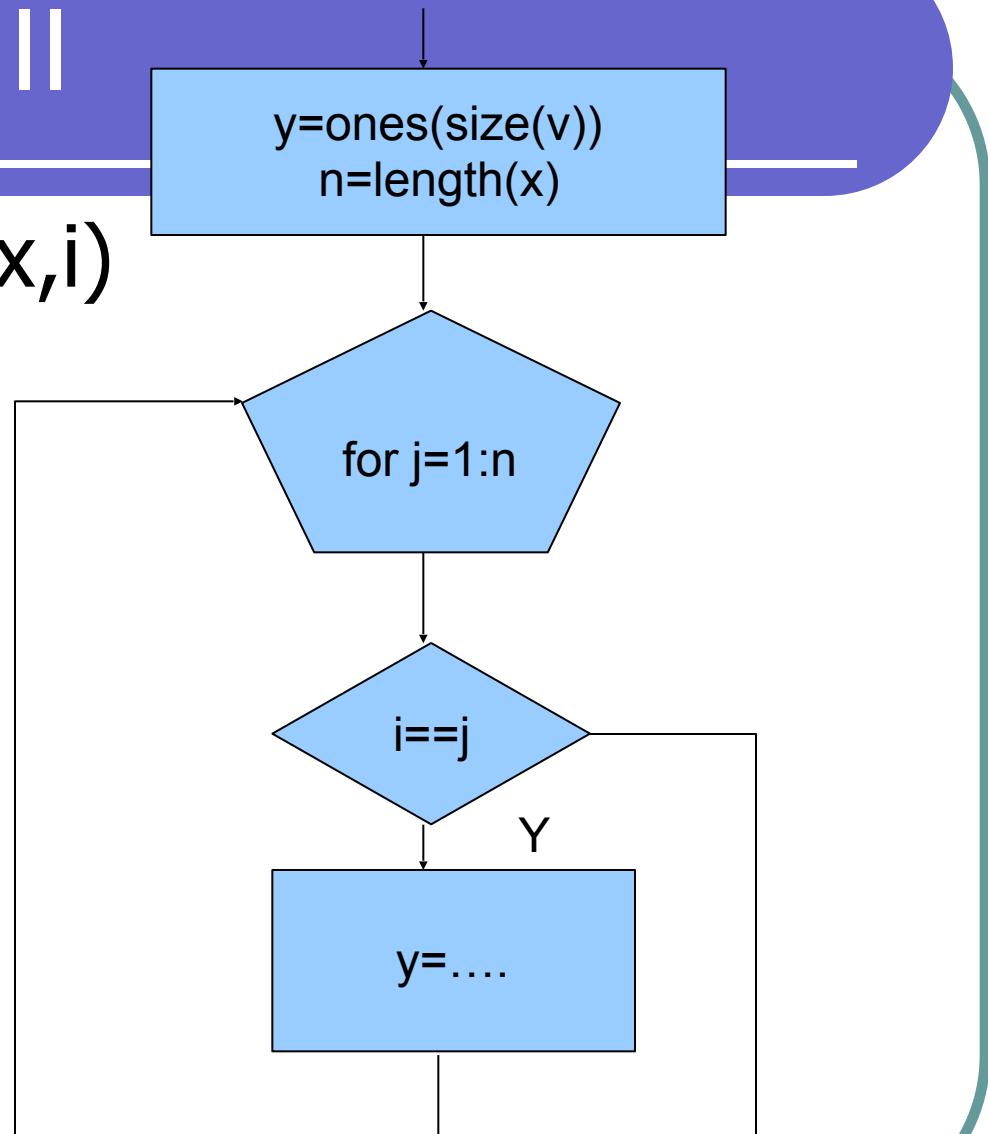

% Substitute elements in v to  $L_i$  defined by  
given knots

%  $y = L_i(v)$

# Implementation II

y=lagrange\_poly(v,x,i)

$$L_i(v) = \prod_{\substack{j=1 \\ j \neq i}}^n \frac{v - x_j}{x_i - x_j}$$

# Evaluation of product form by for-looping

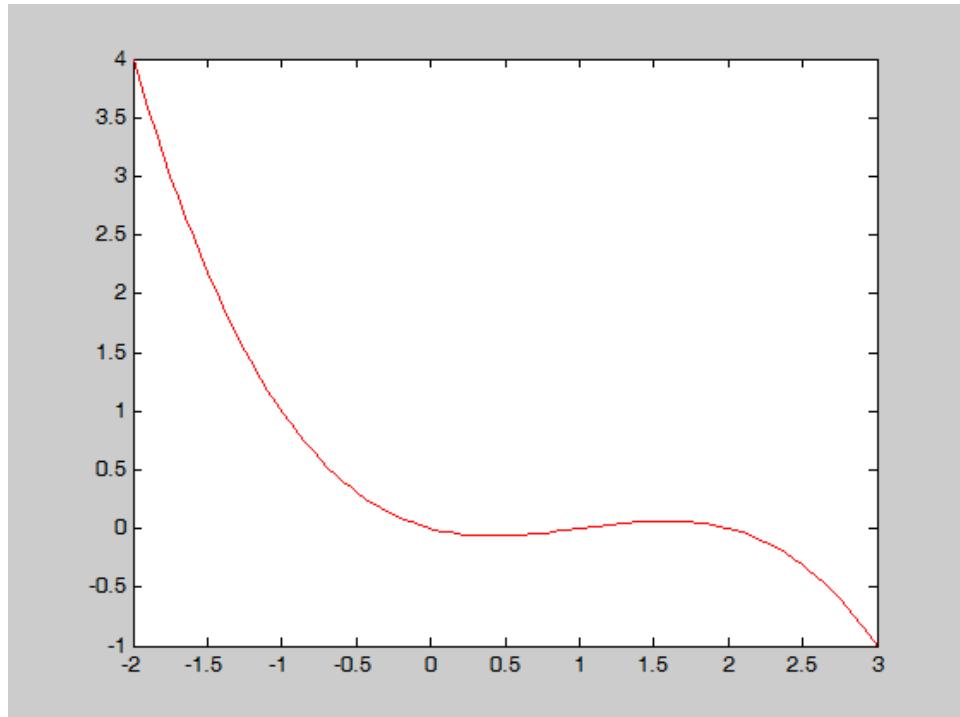

```
function y=lagrange_poly(v,x,i)
% evaluation of Li defined by knots in x
y=ones(size(v));
n=length(x);
for j=1:n
    if j~=i
        v(i)*v(j)/(x(i)-x(j)).
```

$n=4, i=1$

```
v=linspace(-2,3);  
y=lagrange_poly(v,[-1 0 1 2],1);  
plot(v,y);
```

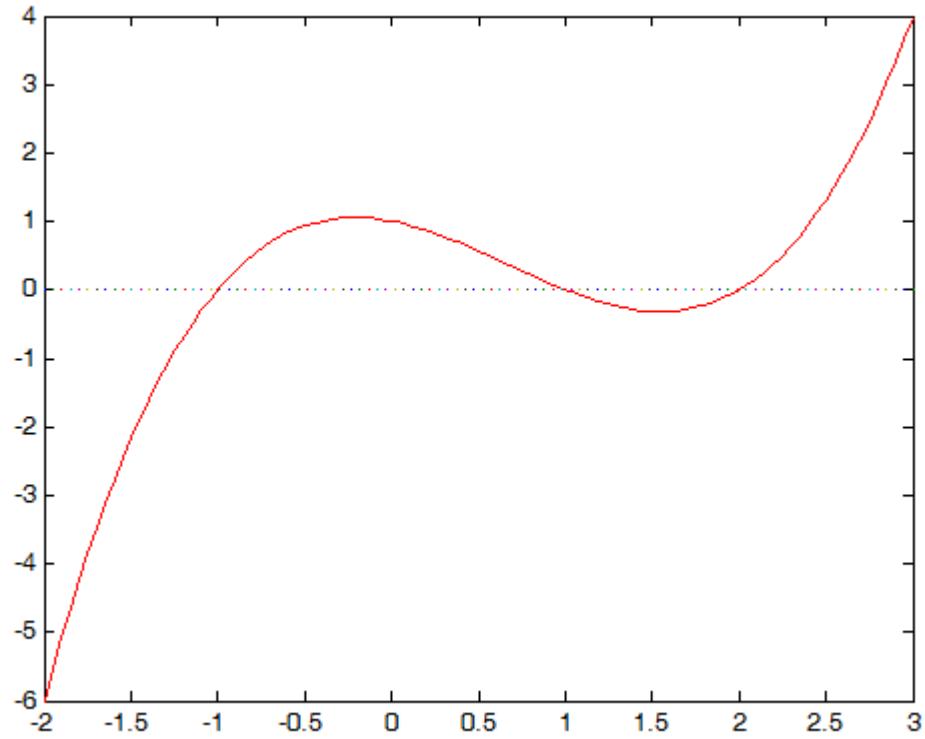

# $n=4, i=1$

```
x=[-1 0 1 2];i=1;n=length(x);  
xzeros=[x(1:i-1) x(i+1:n)];  
pi=poly(xzeros);  
pi=pi/polyval(pi,x(i));  
v=linspace(-2,3);  
plot(v,polyval(pi,v),'r');
```

# $n=4, i=2$ (Implementation I)

```
x=[-1 0 1 2];i=2;n=length(x);
xzeros=[x(1:i-1) x(i+1:n)];
pi=poly(xzeros);
pi=pi/polyval(pi,x(i));
v=linspace(-2,3);
plot(v,polyval(pi,v),'r');
plot(v,0);
```

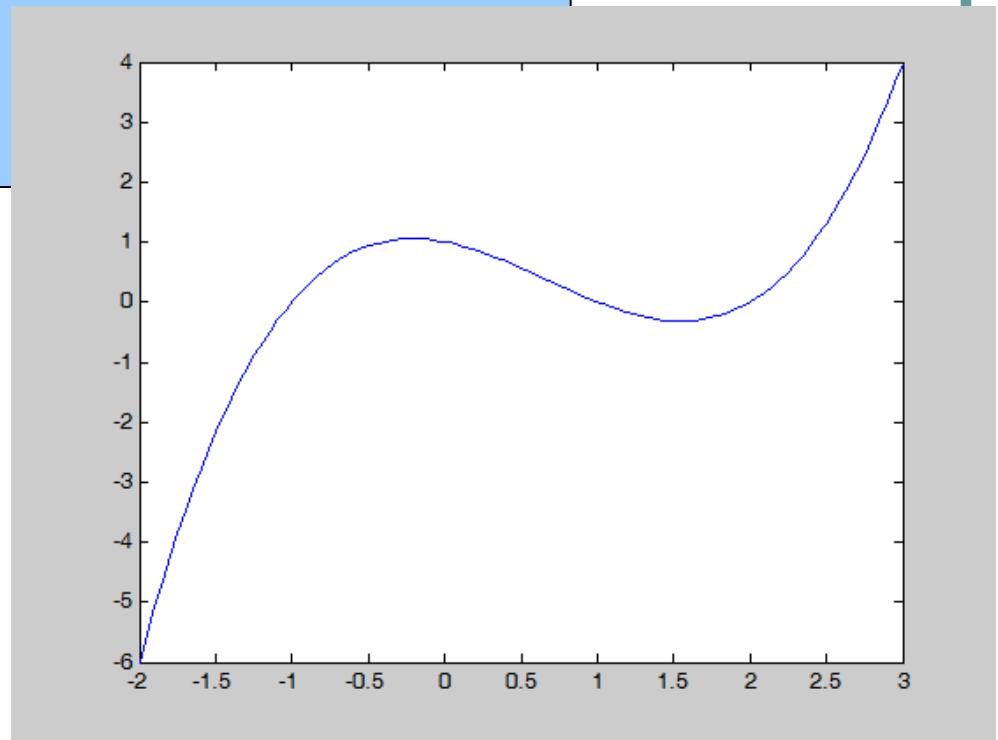

數值

NDHU

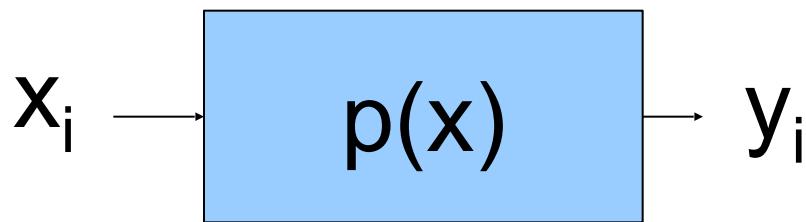

$n=4, i=2$

```
v=linspace(-2,3);
y=lagrange_poly(v,[-1 0 1 2],2);
plot(v,y);
plot(v,0);
```

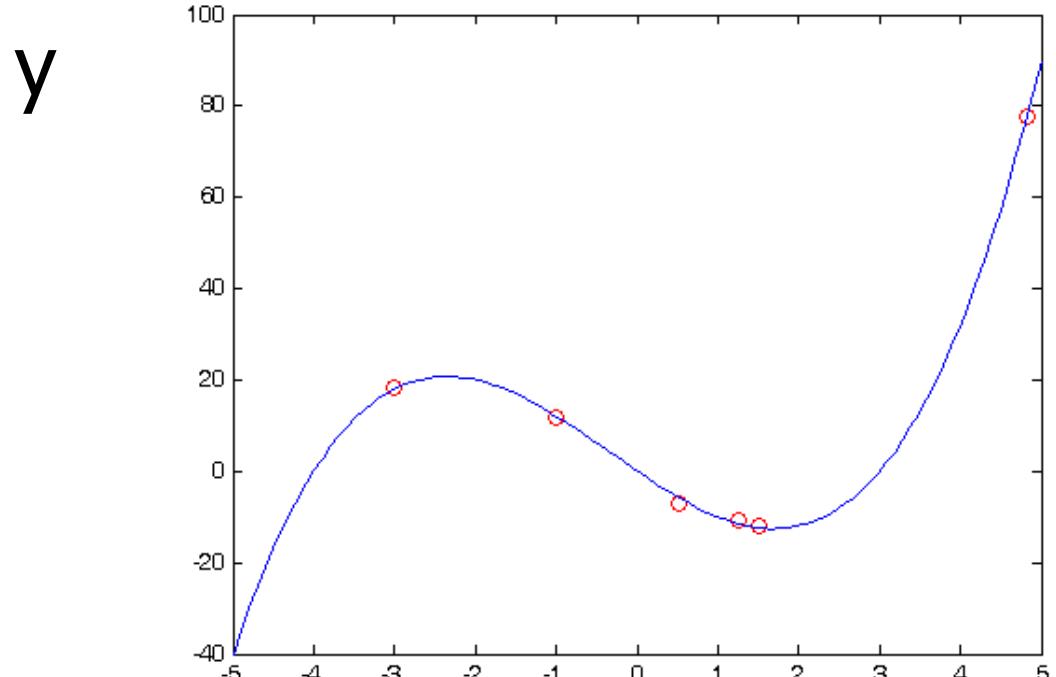

# Polynomial interpolation

- Find a polynomial well interpolating given points
- Input: paired data,  $S=\{(x_i, y_i)\}_i$
- Output: a polynomial  $p(x)$  that pass all points in  $S$

# Sampling

A sample from an unknown target function

# Polynomial interpolation

- Given  $(x_i, y_i), i = 1, \dots, n$
- Find a polynomial that satisfies

$$f(x_i) = y_i$$

for all i

# Interpolating polynomial

- A linear combination of n Lagrange polynomials defined by n knots

$$f(\nu) = \sum_i y_i L_i(\nu)$$

- $f$  is a polynomial of degree  $n-1$
- $L_i$  denotes the  $i$ th Lagrange polynomial

# Verification

$$\begin{aligned}f(x_i) &= \sum_k y_k L_k(x_i) \\&= y_i L_i(x_i) + \sum_{k \neq i} y_k L_k(x_i) \\&= y_i L_i(x_i) \\&= y_i \\\therefore f(x_i) &= y_i \quad \forall i\end{aligned}$$

# Evaluation of interpolating polynomial

- $$f(v) = \sum_i y_i L_i(v)$$

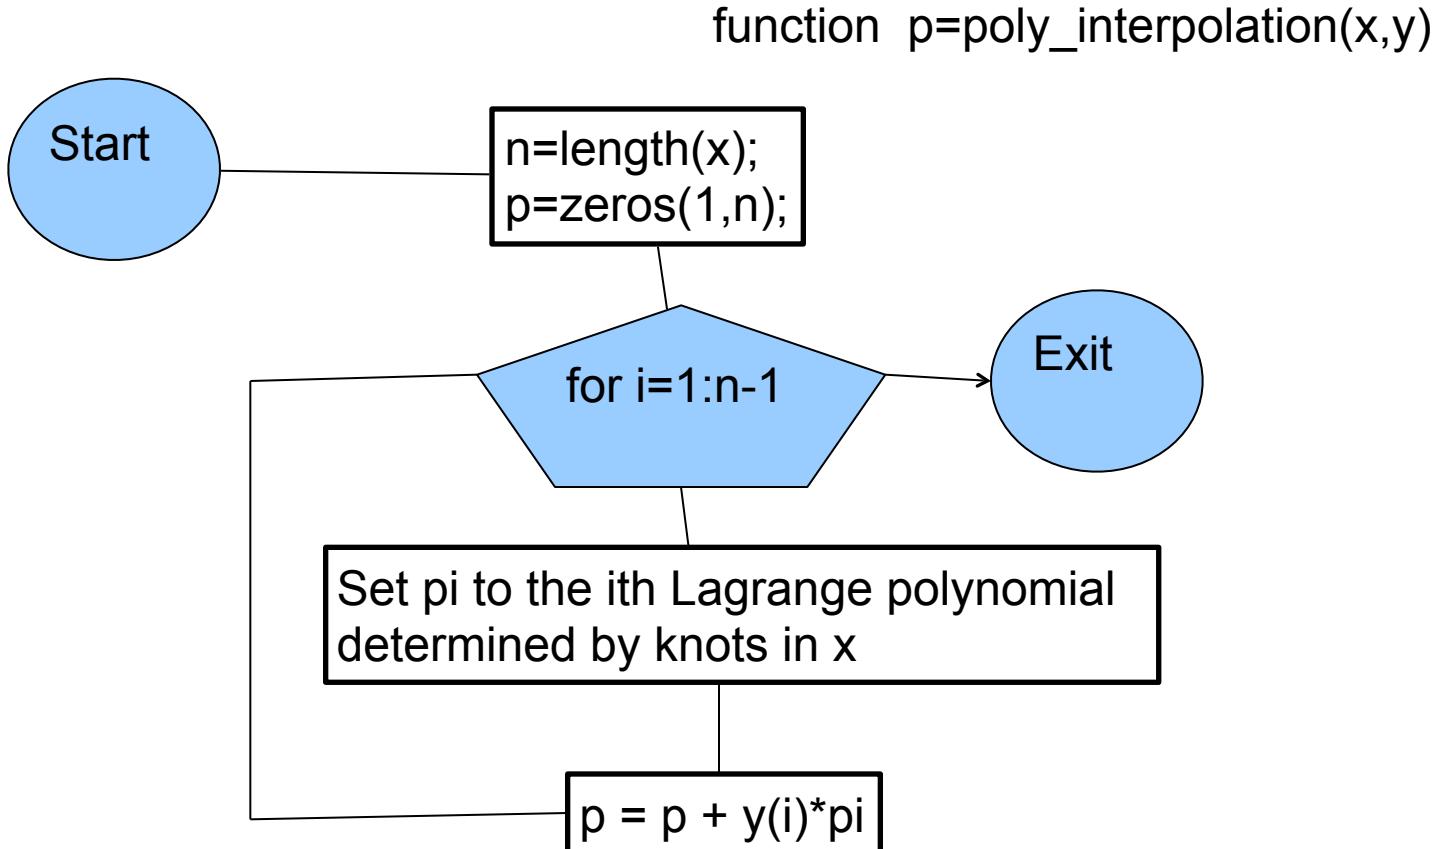

```
function z=int_poly(v,x,y)
```

% x contains n knots

% y contains desired targets

% substitute elements in v to f

# Polynomial interpolation

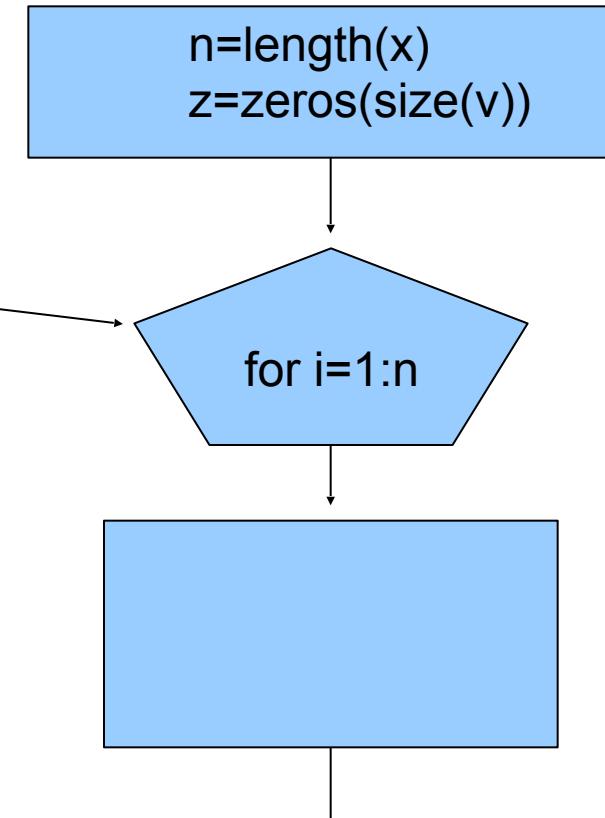

# Evaluation of interpolating polynomial

- $f(v) = \sum_i y_i L_i(v)$

function z=int\_poly(v,x,y)

% call lagrange\_poly(v,x,i) to evaluate  $L_i(v)$

```
function z=int_poly(v,x,y)
    z=zeros(size(v));
    n=length(x);
    for i=1:n
        % Body of loop is here
    end
    return
```
